Predictive redesign: useful event probabilities, no demonstrated direction skill

RANGE IDENTITY

12 ranges → unique high/low pairs
Repeated boundaries count once

EVENT MEANING

Fresh breaches / rejections
kept separate from memory expiry

FORECAST TARGETS

Direction · large displacement · range exit
Annual fits use only prior-year labels

Configurations selected on 2013–2018 only; locked annual walk-forward evaluation on 2019–July 2026. Retrospective gold data, not independent confirmation.

Direction: next close higher

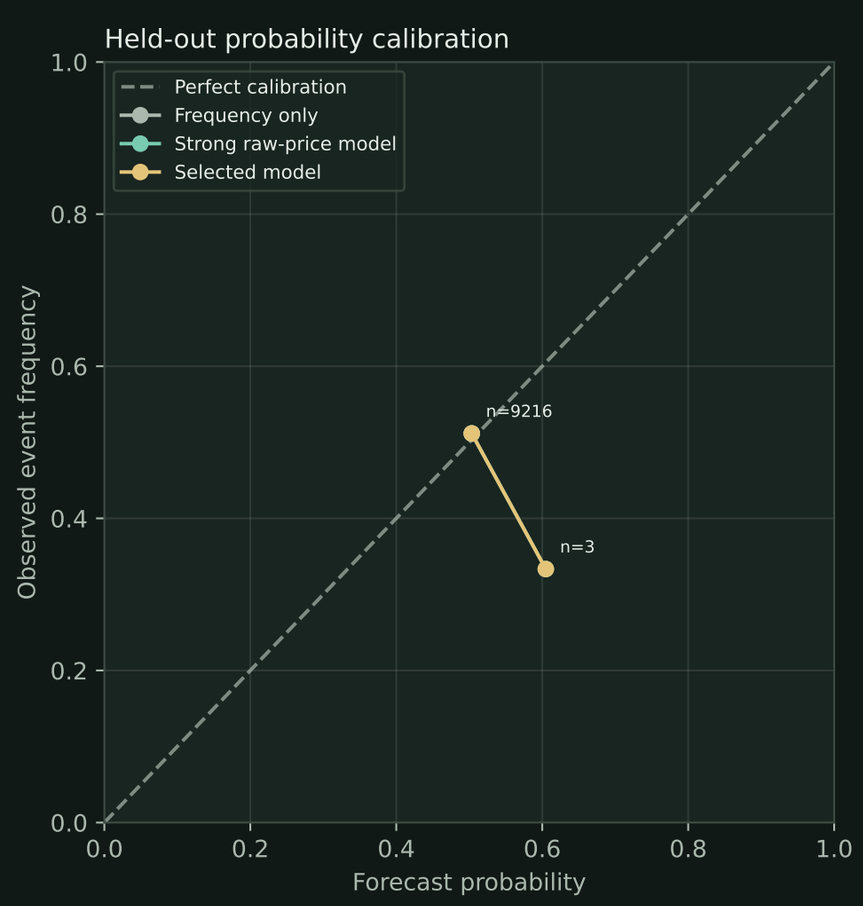
0.11%

higher probability error than historical frequency

Selected: raw_boost

Selected Brier 0.250615
Strong raw baseline 0.250615

No added-structure criterion passed.



Selected forecasts score worse than 50/50.
Do not interpret an upward probability as a validated signal.

Large four-hour displacement

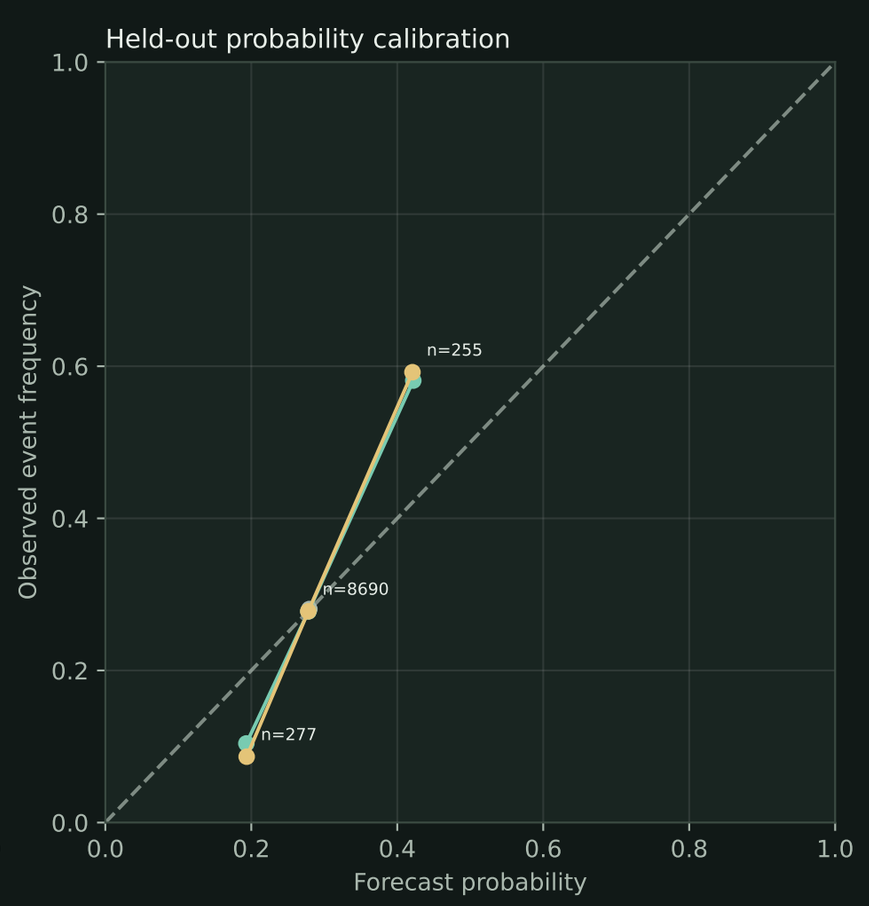
4.73%

lower probability error than historical frequency

Selected: events_boost

Selected Brier 0.192413
Strong raw baseline 0.192242

No added-structure criterion passed.



Improves over frequency in all 8 evaluation years.
The event-state layer does not beat the raw model.

Terminal close outside known range

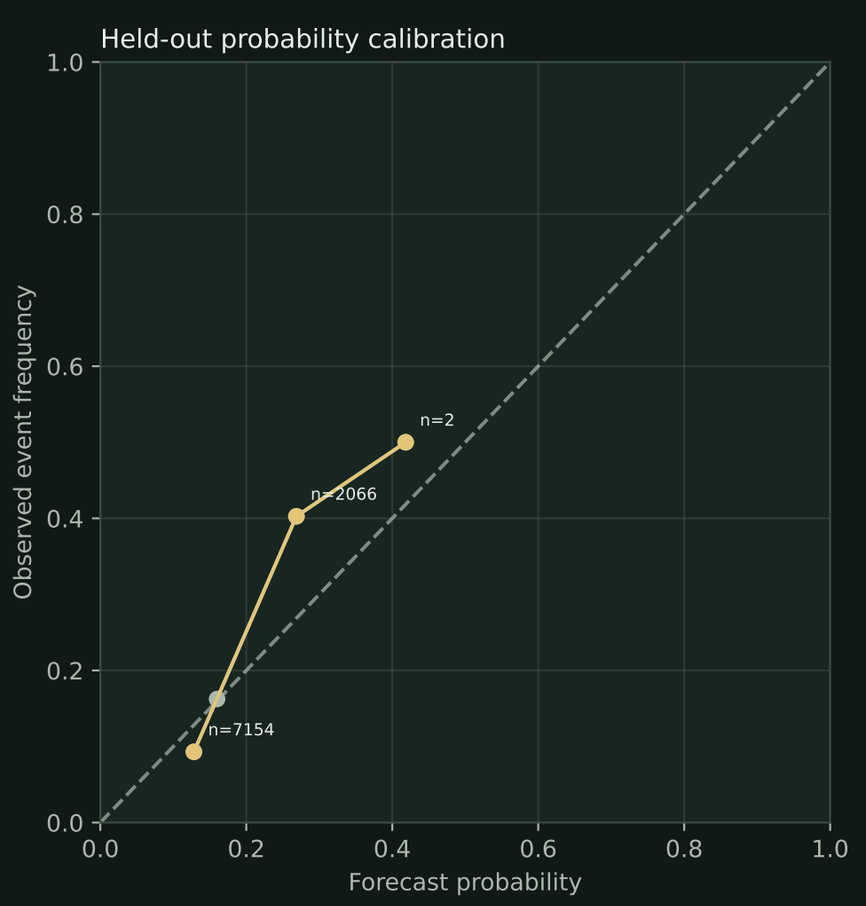
11.44%

lower probability error than historical frequency

Selected: raw_boost

Selected Brier 0.120513
Strong raw baseline 0.120513

No added-structure criterion passed.



Improves over frequency in all 8 evaluation years.
A normal-distance geometry baseline is better still.
