Gold: what Nucleus receives, remembers and notices

OBSERVE

200,000 real M30 bars
600,000 H/L/C price values

→

TRANSFORM

4 timeframes × 3 ranges
12 overlapping measurements

→

REMEMBER

Fixed prices + Fibonacci anchors
Old prices retain their identity

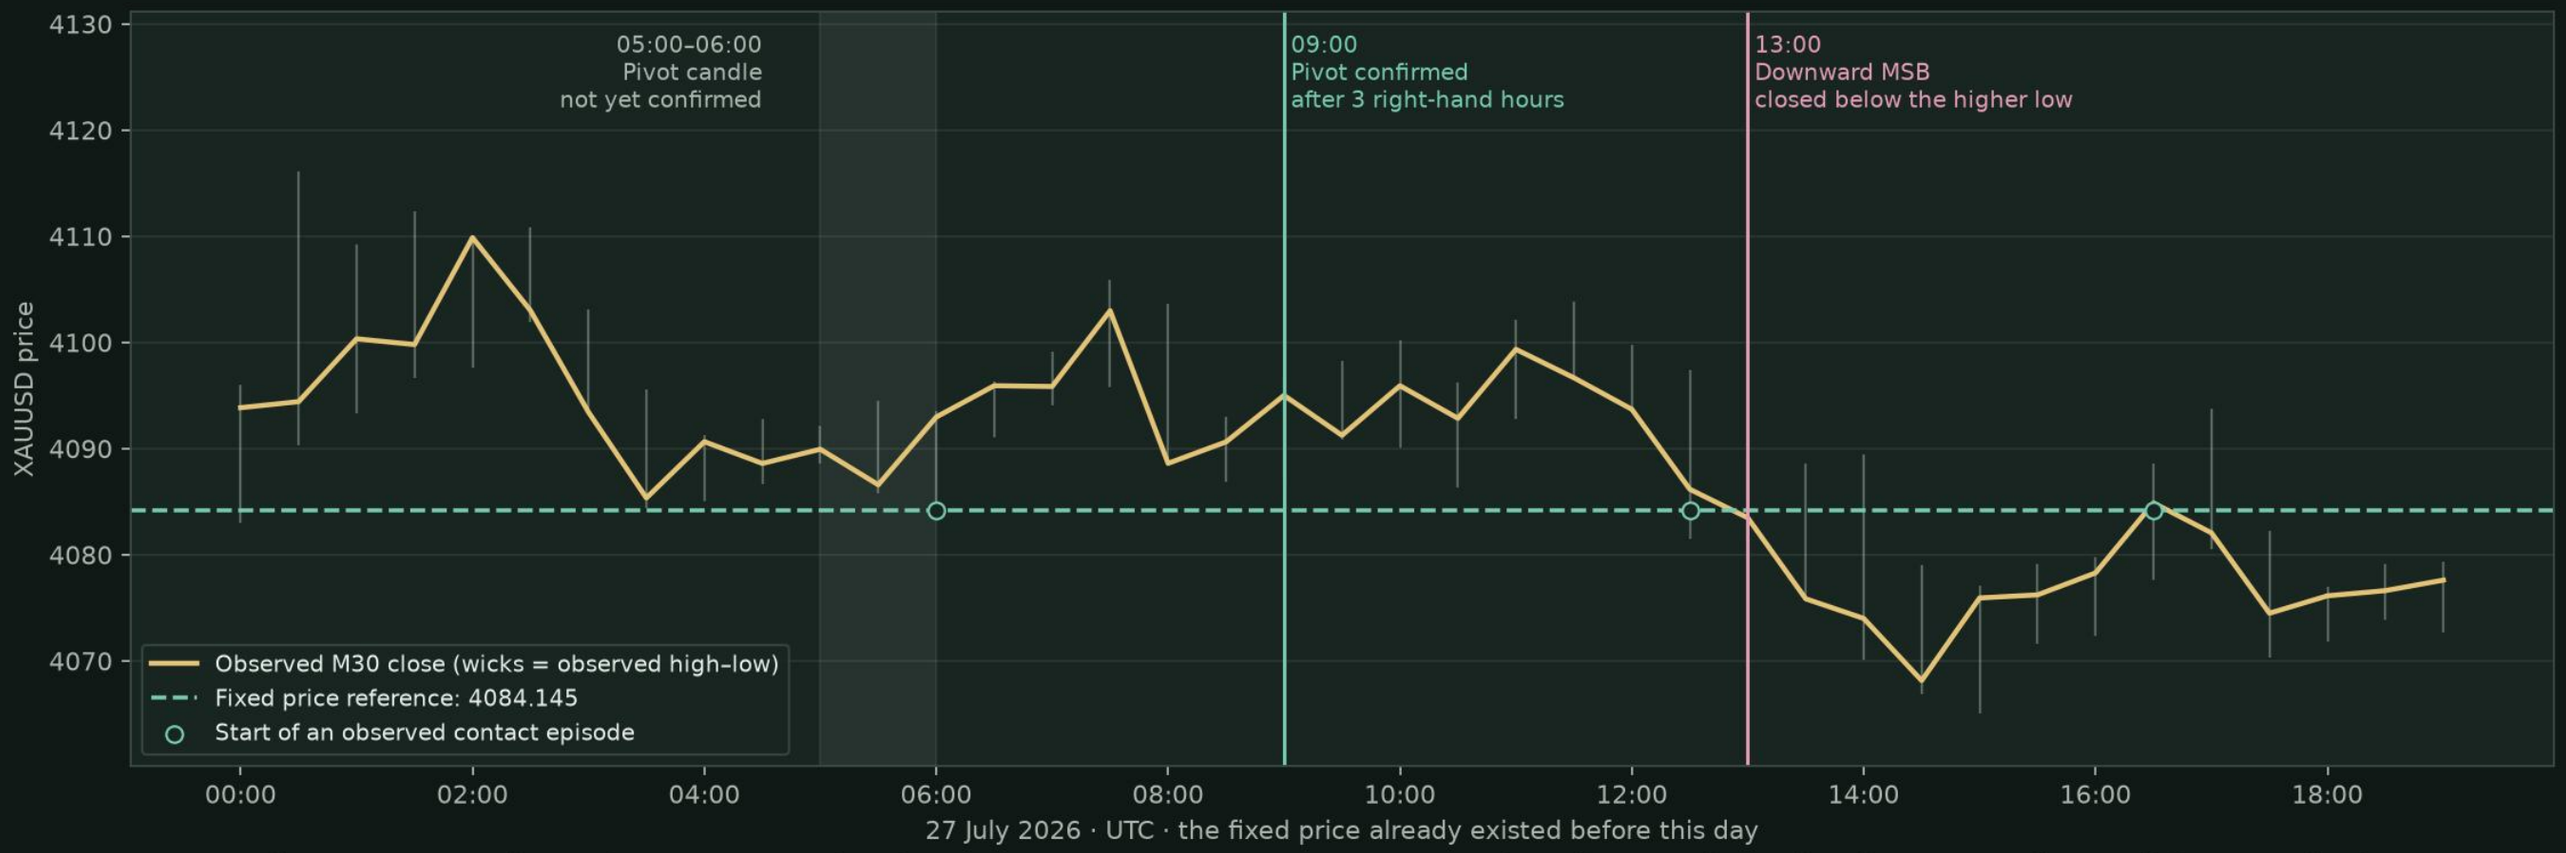

→

NOTICE

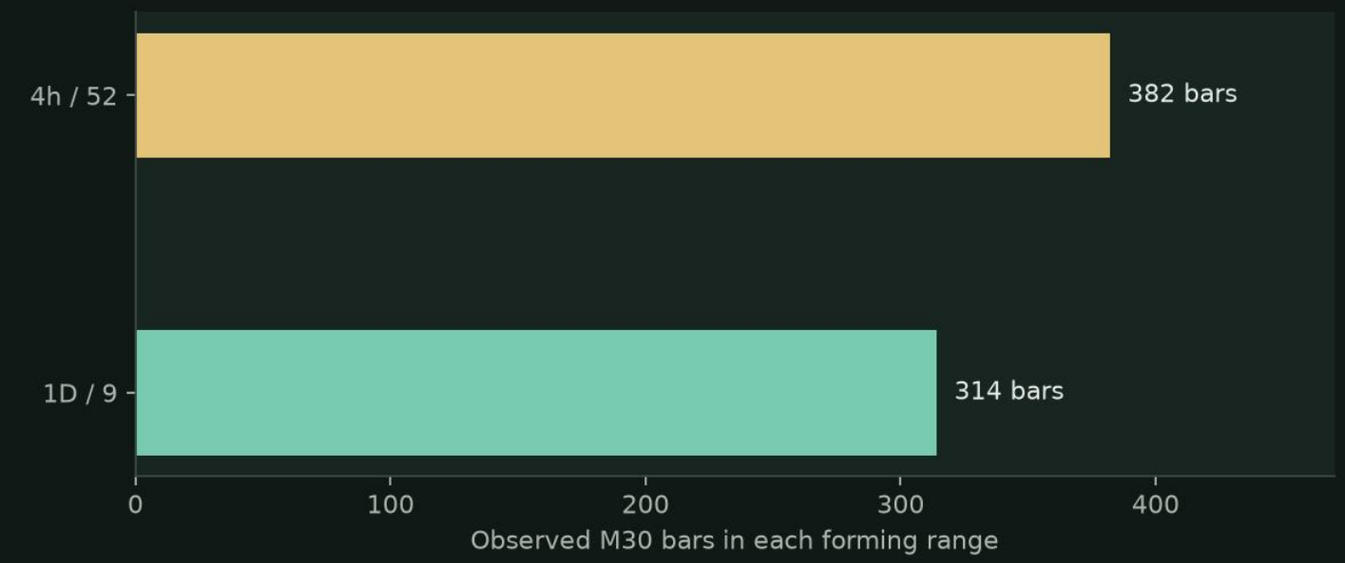

Contacts, returns and MSBs
Each joined to its current state

Past observations only • M30 bars enter at their close • Missing periods stay missing

1 A fixed price gives different events a shared address

2 More input can produce the same retained range

Both retain low 3959.485 and high 4165.775.
The extra 68 observations do not alter this range summary.

3 Incoming data and retained memory have different clocks

406 observations

consecutive closes share the same daily / 52 midpoint

306.5 elapsed hours

That range still retains extremes last observed
1,419.5 hours and 665.5 hours earlier.

Measured at 27 July 2026, 19:00 UTC.
Persistence and overlap are observed; emergence is not established.
